Hiring Manager
Associate Full-Stack Software Engineer
Intramotev
St. Louis, MO

Subject: Application for Associate Full-Stack Software Engineer - Intramotev

Dear Hiring Manager,

I am writing to apply for the Associate Full-Stack Software Engineer position at Intramotev. I completed my M.S. in Computer Science at Washington University in St. Louis this past May, and I am based here in St. Louis already. What drew me to this role specifically is the blend of mobile and embedded work behind it: building the operator-facing interface that runs on a physical tablet in the field, backed by services that talk to real vehicles, is exactly the kind of hardware-facing software I have gravitated toward on my own time.

As a Data Analyst Intern at Lab714, I designed and built the Figma-to-React UI for an all-in-one environmental sensor device, taking it from wireframes to a pixel-perfect, production-ready interface, and I built the AWS data ingestion pipelines that normalized telemetry from a deployed IoT device fleet and powered the real-time dashboards operators used to catch equipment alerts. More recently I built a real-time Android app in Kotlin that decodes deliberate eye blinks into Morse code using live camera-based facial-landmark tracking and a debounced state machine, and I wrote Arduino C++ firmware for an environment monitor that manages a hardware button interface, an LCD display, and a rolling EEPROM buffer that survives power cycles.

As an AI Engineer Intern at Crittero, I worked in TypeScript daily and built a configurable Python CLI test harness with deterministic seeding and CSV export so a TensorFlow/Keras recommendation model's evaluation would be reproducible across configurations. As a Graduate Teaching Assistant for a data engineering course this past semester, I taught fault-tolerant pipeline design and led students through Git-based collaborative workflows and code review. That testing discipline and Git workflow experience is what I would bring to building and testing C# microservices connecting vehicles to operators.

I would welcome the chance to walk you through this work in more detail. My GitHub (github.com/agopalareddy) has the full source for the Android app and the embedded firmware project mentioned above. Thank you for considering my application; I look forward to the possibility of contributing to Intramotev's autonomous railcar fleet.

Sincerely,

Aadarsha Gopala Reddy
